FMA-RMS can help your organization deploy its IT infrastructure in a secure way. We can also install, configure and manage security control and monitoring devices such as firewalls, proxies, Virtual Private Network gateways, and Intrusion Detection Systems.

DEPLOYMENT

SECURITY

"Secure right from the start"

What are the advantages of getting FMA-RMS to deploy your IT infrastructure ?

We can deploy your IT infrastructure securely right from the start, saving you precious time, and removing security holes at installation time.

We will either follow your own preexisting Architecture Plan or we can design one for you.

Do I really need a firewall ?

Firewalls protect your network against attacks and misuses both from outside and inside.

It acts in the same way as a police checkpoint does in real life. It is an essential network security control that you should implement to lower threats on your network.

Do I really need a Virtual Private Network or an Intrusion Detection System ?

A Virtual Private Network allows you to secure communications between two gateways. It is essential if you want to ensure privacy of your branch offices communication with the main office.

An Intrusion Detection System will help you monitor attacks on your network, and will take appropriate measures if needed. It works similarly to a building alarm, notifying you when an attack takes place.
